DA5401 Data Analytics Labarotary

###

Assignment 6 - Submitted by: DA24M011 - Nandhakishore C S

Task 1 [**40 Points**] Given the dataset (Amazon's MASSIVE dataset) - has data from 51 Languages in the latest version. For the given question, we are downloading the 27 files corresponding to languages which use the roman / latin script.

Importing Libraries

[1]:
```python
import os
import numpy as np
from datasets import load_dataset
from unidecode import unidecode # type: ignore

import unicodedata
from sklearn.naive_bayes import MultinomialNB
from sklearn.preprocessing import LabelEncoder
from sklearn.pipeline import Pipeline
from sklearn.metrics import classification_report, confusion_matrix,␣
 ↪ConfusionMatrixDisplay, accuracy_score
from sklearn.feature_extraction.text import CountVectorizer, TfidfVectorizer
import pandas as pd
```

0.0.1 TASK 1

Defining the languages which use Latin Script and downloading the corresponsing files from the main dataset.

[2]:
```python
# Define the locales we are interested in (i.e.) the languages which use Latin␣
 ↪Script
locales = [
    'af-ZA', 'da-DK', 'de-DE', 'en-US', 'es-ES', 'fr-FR', 'fi-FI', 'hu-HU',␣
 ↪'is-IS', 'it-IT',
    'jv-ID', 'lv-LV', 'ms-MY', 'nb-NO', 'nl-NL', 'pl-PL', 'pt-PT', 'ro-RO',␣
 ↪'ru-RU', 'sl-SL',
    'sv-SE', 'sq-AL', 'sw-KE', 'tl-PH', 'tr-TR', 'vi-VN', 'cy-GB'
]
```

[3]:
```
# from datasets import load_dataset - using Huggingface load dataset module /␣
↪function
df_raw = load_dataset("AmazonScience/massive", "all")
```

[4]:
```
df_raw
```

[4]:
```
DatasetDict({
    train: Dataset({
        features: ['id', 'locale', 'partition', 'scenario', 'intent', 'utt',
'annot_utt', 'worker_id', 'slot_method', 'judgments'],
        num_rows: 587214
    })
    validation: Dataset({
        features: ['id', 'locale', 'partition', 'scenario', 'intent', 'utt',
'annot_utt', 'worker_id', 'slot_method', 'judgments'],
        num_rows: 103683
    })
    test: Dataset({
        features: ['id', 'locale', 'partition', 'scenario', 'intent', 'utt',
'annot_utt', 'worker_id', 'slot_method', 'judgments'],
        num_rows: 151674
    })
})
```

[5]:
```
# Downloading and storing datafiles for 27 languages

output_dir = 'language_files'
os.makedirs(output_dir, exist_ok=True)

# Extract utterances for each locale
for locale in locales:
    file_path = os.path.join(output_dir, f'{locale}.txt')
    with open(file_path, 'w', encoding='utf-8') as f:
        for partition in ['train', 'validation', 'test']:
                for example in df_raw[partition]:
                        if example['locale'] == locale:
                                utt = example['utt']
                                f.write(utt + '\n')
```

0.0.2 TASK 2

The dataset is split into three parttions:

1. Train
2. Validation

3. Test

From the training partition, we get the ‘utt’ column as the input features (the sentences with / without) accents and the corresponsing country name in the ‘locale’ column as the label. Instead of using the tokens from the dataset, Tokens are generated using CountVectoriser from sklearn’s feature extraction module.

Using ‘.filter’ function to get the data corresponding to the country names

```
[6]: df_filtered = df_raw.filter(lambda x: x['locale'] in locales)
     df_filtered
```

```
[6]: DatasetDict({
         train: Dataset({
             features: ['id', 'locale', 'partition', 'scenario', 'intent', 'utt',
     'annot_utt', 'worker_id', 'slot_method', 'judgments'],
             num_rows: 310878
         })
         validation: Dataset({
             features: ['id', 'locale', 'partition', 'scenario', 'intent', 'utt',
     'annot_utt', 'worker_id', 'slot_method', 'judgments'],
             num_rows: 54891
         })
         test: Dataset({
             features: ['id', 'locale', 'partition', 'scenario', 'intent', 'utt',
     'annot_utt', 'worker_id', 'slot_method', 'judgments'],
             num_rows: 80298
         })
     })
```

Building Multinomial Naive Bayes Model - without removing accents

```
[7]: # No accent removal
     df1_train = df_filtered['train']
     df1_val = df_filtered['validation']
     df1_test = df_filtered['test']
```

```
[8]: pipeline = Pipeline([
         ('vectoriser', CountVectorizer()),
         ('classifier', MultinomialNB())
     ])

     pipeline.fit(df1_train['utt'], df1_train['locale'])
```

```
[8]: Pipeline(steps=[('vectoriser', CountVectorizer()),
                     ('classifier', MultinomialNB())])
```

Model’s perfomance metrics for Train Partition

```
[9]: train_predictions = pipeline.predict(df1_train['utt'])
     print("Training Data Performance:")
     print(classification_report(df1_train['locale'], train_predictions))
     print("Training Accuracy:", accuracy_score(df1_train['locale'],␣
      ↪train_predictions))
```

```

```

Now, building a MultinomialNB model with accent removal from the data. For the "unicodedata" library is used.

[28]:
```
# ACCENT REMOVAL

df2 = df_filtered
# Function to deaccent characters
def deaccent(text):
    return ''.join(c for c in unicodedata.normalize('NFD', text) if unicodedata.
 ↪category(c) != 'Mn')

# Create a directory to store the files
# Iterate through the dataset and save sentences to respective files
for locale in locales:
    for partition in ['train', 'validation', 'test']:
           for item in df2[partition]:
                  if item['locale'] == locale:
                          sentence = item['utt']
                          sentence = deaccent(sentence)
```

```
[29]: df2_train = df2['train']
      df2_val = df2['validation']
      df2_test = df2['test']
```

Building Multinomial Naive Bayes Model - with accents

```
[30]: pipeline = Pipeline([
          ('vectoriser', CountVectorizer()),
          ('classifier', MultinomialNB())
      ])

      pipeline.fit(df2_train['utt'], df2_train['locale'])
```

```
[30]: Pipeline(steps=[('vectoriser', CountVectorizer()),
                      ('classifier', MultinomialNB())])
```

Model's perfomance metrics for Train Partition

```
[31]: train_predictions = pipeline.predict(df2_train['utt'])
      print("Training Data Performance:")
      print(classification_report(df2_train['locale'], train_predictions))
      print("Training Accuracy:", accuracy_score(df2_train['locale'],␣
       ↪train_predictions))
```

```
Training Data Performance:
              precision    recall  f1-score   support

Testing Accuracy: 0.9833868838576303
```

From the above results, We can see that keeping accents in the data is useful for language classification. Accuracy for model without removing accents is 99% and accuracy for model without accents is 98%. Note the fact that, the Precision for model with accents is higher than the precision for the model wihtout accents.

TASK 3 Collapsing the choosen 27 languages into a 4 label dataset, where the labels are the continent they are spoken in. Building a Regularised Discriminent Analyser (RDA) over the above modified data with Linear Discriminent Analyser (LDA) and Quadratic Discriminent Analyser (QDA) with a parameter which balances the prfedictions of both.

[18]:
```python
continent_groups = {
    'af-ZA': 'Africa', 'sw-KE': 'Africa',
    'da-DK': 'Europe', 'de-DE': 'Europe', 'es-ES': 'Europe', 'fr-FR': 'Europe',␣
 ↪'fi-FI': 'Europe',
    'hu-HU': 'Europe', 'is-IS': 'Europe', 'it-IT': 'Europe', 'lv-LV': 'Europe',␣
 ↪'nb-NO': 'Europe',
    'nl-NL': 'Europe', 'pl-PL': 'Europe', 'pt-PT': 'Europe', 'ro-RO': 'Europe',␣
 ↪'ru-RU': 'Europe',
    'sl-SL': 'Europe', 'sv-SE': 'Europe', 'sq-AL': 'Europe', 'cy-GB': 'Europe',
    'jv-ID': 'Asia', 'ms-MY': 'Asia', 'tl-PH': 'Asia', 'tr-TR': 'Asia', 'vi-VN':
 ↪ 'Asia',
    'en-US': 'North America'
}
```

Creating a extral column in the dataset and adding the continent value to the corresponding language and then passing the new column as the label for the RDA Model

[19]:
```python
def assign_continent(row):
    locale = row['locale']
    return continent_groups.get(locale, 'NA')
```

Using ‘lambda’ functions in python to apply the above function to add the continent names.

```
[20]: train_data = df_filtered['train'].map(lambda row: {'continent':␣
       ↪assign_continent(row)})
      val_data = df_filtered['validation'].map(lambda row: {'continent':␣
       ↪assign_continent(row)})
      test_data = df_filtered['test'].map(lambda row: {'continent':␣
       ↪assign_continent(row)})
```

Class for Regularised Discriminent Analysis

```
[34]: from sklearn.base import BaseEstimator, ClassifierMixin # to get two␣
       ↪classifiers inside a single class
      from sklearn.discriminant_analysis import LinearDiscriminantAnalysis,␣
       ↪QuadraticDiscriminantAnalysis
      from sklearn.metrics import accuracy_score
